

WATER CONSERVATION Aerators

Conserve water and save money

The bathroom faucet is the area in the bathroom where the least amount of water is used. However, standard faucet aerators can also be a significant source of water waste. The average bathroom faucet tap uses 2.2 gallons of water every minute. This is almost the equivalent of the modern shower head, which uses 2.5 gallons per minute. Installing water saving aerators is a simple, cost effective way to reduce water use and water bills..
